

TUTORIAL 5

5) Write a C++ program to overload the temperature() function for converting Celsius to Fahrenheit and Fahrenheit to Celsius.

INPUT:

```
#include <iostream>
using namespace std;

class Temperature
{
public:
    void temperature(float celsius)
    {
        float fahrenheit = (celsius * 9 / 5) + 32;
        cout << "Celsius to Fahrenheit = " << fahrenheit << " F" << endl;
    }

    void temperature(int fahrenheit)
    {
        float celsius = (fahrenheit - 32) * 5.0 / 9;
        cout << "Fahrenheit to Celsius = " << celsius << " C" << endl;
    }
};

int main()
{
    Temperature obj;

    obj.temperature(37.0f);    obj.temperature(98);
    return 0;
}
```

OUTPUT:

A screenshot of a terminal window with a black background and white text. It shows the output of the C++ program: "Celsius to Fahrenheit = 98.6 F" on the first line and "Fahrenheit to Celsius = 36.6667 C" on the second line.

```
Celsius to Fahrenheit = 98.6 F
Fahrenheit to Celsius = 36.6667 C
```
